## Mil-Spec Reference

Eaton Corporation supplies products that meet many Military and Federal Specifications. The extent of this capability is indicated in the following listing.

We have purposely omitted revision letters so that this list does not become outdated and restrictive in nature.

The Marine and Military Group with prime responsibility for the specified product is the best and quickest source of information. The address is as follows:

Eaton  
14615 Lone Oak Road  
Eden Prairie, MN  
55344-2287  
(952) 937-7190 or  
(952) 937-7263  
Fax: (952) 937-7394

## How To Order

### How to order

Accurate processing and prompt delivery of your order depends on easy identification of your requirements. Please order Eaton Aeroquip parts using correct part numbers as described in this catalog. Inquiries and orders should be directed to your Eaton Aeroquip Distributor or:

Eaton  
14615 Lone Oak Road  
Eden Prairie, MN  
55344-2287  
(952) 937-7190 or  
(952) 937-7262  
Fax: (952) 937-7394  
[www.hydraulics.eaton.com](http://www.hydraulics.eaton.com)

### Part numbers and dash sizes

Dash size designates the nominal size in 16ths of an inch. This number immediately follows the part number and is separated from it with a dash.

### Dimensions

Dimensions given in this catalog for Eaton Aeroquip products are approximate and should be used for reference only. Exact dimensional information for a given product is subject to change and varying tolerances; contact Eaton directly for full current information.

### Hose assemblies

Eaton manufactures the terminal ends of our hose fittings to the appropriate requirements established by the SAE. Therefore, the performance ratings of these hose fittings meet the SAE/MIL SPEC requirements. It is possible to order a hose assembly with a fitting terminal end that has a performance rating lower than the hose rating. When ordering hose assemblies, please keep the connecting end performance rating in mind since this may affect overall hose assembly performance.

Hose assembly components (hose and fittings) are easily assembled in the field. However, factory assembled reusable and crimped hose assemblies are available. For complete information, contact Eaton.

### Cut length hose

Cut lengths of hose should be ordered as shown below by specifying lengths in inches.

For numeric part numbers: AE369-10-00484

Hose type \_\_\_\_\_

Hose size (in 16ths of an inch) \_\_\_\_\_

Cut length (in inches) \_\_\_\_\_

last digit is in 1/16ths of an inch 00484 = 48 1/2 inches

For alpha-numeric part numbers: FC163-08-00484

Hose type \_\_\_\_\_

Hose dash size \_\_\_\_\_

Cut length (in inches) \_\_\_\_\_

Last digit is in 1/16ths of an inch 00484 = 48 1/2 inches

### Bulk hose

Bulk hose should be ordered by specifying length in feet as shown below.

Complete numbers: 150 ft.-AE372-10

Quantity (in feet) \_\_\_\_\_

Hose type \_\_\_\_\_

Hose size (in 16ths of an inch) \_\_\_\_\_

Note: Length tolerance for hose, assemblies and sleeves is:

Up to and including 12 inches:  $\pm 1/8"$

Above 12 inches to and including 18 inches:  $\pm 3/16"$

Above 18 inches to and including 36 inches:  $\pm 1/4"$

Above 36 inches:  $\pm 1%$  of length

# Hose

## Hose Pressure By Size

### Hose dash size to maximum operating pressure

This table is intended as a guide in the selection of hose by maximum operating pressure.

It is not a guarantee.

Final selection is further dependent on fluid and ambient temperature, concentration of agent, intermittent or continuous exposure, etc.

PART NUMBER	PAGE	HOSE DASH SIZE

Steel	26-32
SAE 45°	27-29
Universal	27-29
Compression Type	28
Accessories see page Assembly	149-152
Instructions see page	165

**Construction:** Synthetic rubber tube, textile braid reinforcement, synthetic rubber cover.

**Application:** For gasoline, crude, fuel and lubricating oils, air and water. Does not provide a fire-resistant product per USCG requirements: Table 56, 60-25 (c), USCG 115 Title 46, however, it does have a self-extinguishing cover. For more specific information on fluid applications, see page 176.

**Operating Temperature Range:** -40°F to +180°F (-40°C to 82°C). Air not to exceed +160°F (71°C). Water not to exceed +150°F (+66°C).

## 2565

**Construction:** AQP elastomer tube, polyester inner braid, single wire braid reinforcement and polyester braid cover. Blue for identification.  
**Application:** Hydraulics handling petroleum based fluids, air, gasoline, fuel and lubricating oil and other industrial fluids. Exceeds SAE100R5 and J1019 and is NAVSEA approved for shipboard applications per 9505, OPR: 56Y231, Ser: 56Y23/650. For more specification information on fluid applications, **see page 176.**  
**Operating Temperature Range:** Suitable for many applications between -55°F. and +300°F (-49°C to +150°C). Air not to exceed +250°F (+121°C).  
 †Maximum negative pressures shown for -16 and larger are suitable only for hose which has suffered no external damage or kinking. If greater negative pressures are required for -16 and larger hoses, the use of an internal support coil is recommended.  
 ‡Does not comply with SAE100R5 operating pressure of 350 psi or Minimum burst of 1400 psi.

FITTING REFERENCE	PAGE
Pipe	35
Dogleg	54-55, 88
Steel	45, 57
Flange	57, 59, 61, 65, 89-99
Split Clamp	66-67, 100-103
108° Return	104
Accessories see page Assembly	149-152
Instructions see page	170

**Construction:** Synthetic rubber tube, textile inner braid, single steel wire braid reinforcement, outer textile braid and synthetic rubber cover.  
**Application:** Hydraulics, fuel and lube oils, fresh and salt water, low pressure air, nitrogen and butane. Approved per Technical Directive for Piping Devices – Flexible Hose Assemblies, S6430-AE-TED-010, Volume 1. AE370-40 hose utilizes segmented socket fittings only, AE370-48 hose utilizes either screw together or segmented socket fittings. For more specific information on fluid compatibility, see page 176.  
**Operating Temperature Range:** -40°F to +275°F (-40° C to +100°C).  
 \*Internal support coil is required.  
 \*\*Applicable only when using segment type Marine Fittings.

## **AE371**

**High Pressure Air  
Meets MIL-H-24135/5  
Non Mil-Spec  
Part Number 1529**

**Construction:** Synthetic rubber tube, double wire braid reinforcement, textile braid and perforated synthetic rubber cover.

**Application:** For pneumatic applications. Perforated cover prevents blistering, assures better high pressure service, and approved per Technical Directive for Piping Devices-Flexible Hose Assemblies, S6430-AE-TED-010, Volume 1. For more specific information on fluid compatibility, **see page 176.**

**Operating Temperature Range:** -40°F to +212°F (-40°C to +100°C).  
To prevent blistering when used for pneumatic applications.

\*Internal support coil is required.

Brass/Steel	130-131
Dogleg	132
Accessories see page	149-152
Assembly Instructions see page	169

**Construction:** Extruded PTFE tube, single stainless steel wire braid reinforcement cover.

**Application:** Temperature range and chemical inertness make Teflon hose suitable for a variety of applications. Some are: potable water, electronic cooling, hot lube oil, compressor discharge, saturated steam (200 psi max.), and most chemicals. For more specific information on fluid compatibility, see page 176. Approved for U.S. Navy shipboard applications per SEA 53217, 9055, Ser 312. Not recommended for steam-cold water cycling.

**Operating Temperature Range:** -100°F to +500°F (-74°C to +260°C).

†Steam 200 psi at +388° F max. Engineering is available for specific critical temperature requirements, contact Eaton.

\*Maximum negative pressures shown for -16 and larger are suitable for hose which has suffered no external damage or kinking. If greater negative pressures are required for -16 and larger hoses, the use of an internal support coil is required. Use of an internal support coil in -6 and larger Teflon hose is recommended for true support where extended or continuous service at high temperature together with low or negative pressure.

③ Sleeve	2	AE11497H	-8	304 Cres
④ Socket	6	AE11496H	-8	4130 Norm
⑤ Retainer	2	AE11498H	-8	4140 Norm
⑥ Hose	1	678	-8	Teflon

#### Applications:

Aeroquip Pneumatic Teflon\* Hose Assemblies are suitable for high pressure service with inert gas systems where operating pressures reach 5500 psi (351.6 Kg/cm<sup>2</sup>). The hose is recommended for air, nitrogen and other inert gases, and is also suitable for helium and helium mixtures where a relatively high effusion rate can be accepted. Aeroquip 678 Hose is suitable in a temperature range from -65°F to +450°F. It is NOT recommended for pure oxygen lines without specific engineering approval from Eaton in each case. Primary shipboard applications include compressor discharge lines in H.P. air systems, and charging lines in air and nitrogen systems. The hose reinforcement is multiple spiral layers of 300-series stainless steel wire.

#### Lengths:

Aeroquip 678619 and AE1000120 Hose Assemblies are available in continuous lengths up to 40 feet. Longer lengths can be assembled using C.P.V. union fittings, or by specifying integral union nipple assemblies.

#### Fittings:

The standard reusable or crimped socket fittings are illustrated above with CRES components. The straight thread male C.P.V. "O" Ring style is the standard end configuration. However, a 37° flare swivel fitting and a Walseal male fitting can be supplied on special order.

### AE1000120 with crimped fittings

COMPONENTS AE1000120 CRIMPED SOCKET, C.P.V. MALE O-RING

DESCRIPTION	REQ'D PER ASS'Y	PART NUMBER	SIZE	MATERIAL
① Nipple	2	AE10512H	-8	304 Cres
② Socket	2	AE10513H	-8	304 Cres
③ Hose	1	678	-8	Teflon

#### Certification:

The 678619 Hose Assembly is supplied with certification. Traceability documentation to NavShips 0948-045-7010, Level 1, including heat numbers, can be supplied at additional charge when requested.

\*Teflon is a DuPont trademark.

#### How to Order:

The Aeroquip 678619 and AE1000120 Teflon Hose Assemblies should be ordered as detailed below. The complete part number will include the size (-8 only), and the overall length in inches from sealing surface to sealing surface.

#### Example:

Complete Part Number 678619 - 8 - 0143

## How To Order

### How to order

Accurate processing and prompt delivery of your order depends on easy identification of your requirements. Please order Aeroquip parts using correct part numbers as described in this catalog. Inquiries and orders should be directed to your Eaton Aeroquip Distributor or:

Eaton  
14615 Lone Oak Road  
Eden Prairie, MN  
55344-2287  
(952) 937-7190 or  
(952) 937-7262  
Fax: (952) 937-7394  
[www.hydraulics.eaton.com](http://www.hydraulics.eaton.com)

### Part numbers and dash sizes

Dash size designates the nominal size in 16ths of an inch. This number immediately follows the part number and is separated from it with a dash.

Fittings with "FC" or "FJ" part numbers will have the size expressed in four numerals. The first two numerals indicate the size of the connecting end and the second two numerals indicate the size of the hose end. All other fittings are followed by a dash number which is the nominal size of the fitting expressed in 16ths of an inch. Where two dash numbers are given, the first one generally indicates the pipe or port size and the second indicates the tube or hose size. The hose dash number should always be the same as the last dash number on the fitting.

### Dimensions

Dimensions given in this catalog for Aeroquip products are approximate and should be used for reference only. Exact dimensional information for a given product is subject to change and varying tolerances; contact Eaton directly for full current information.

### Globally Standardized Pressure Ratings

Eaton has standardized hose burst and operating pressure ratings in cataloging, worldwide. This move toward standardization will slightly alter some of the pressures ratings listed for hoses in this catalog as pressures are rounded off. This is a paper conversion only. This action has no effect on the actual testing and certification of Aeroquip hoses to stringent product standards.

### WARNING

Eaton manufactures the terminal ends of our hose fittings to the appropriate requirements established by the SAE. Therefore, the performance ratings of these hose fittings meet the SAE requirements. It is possible to order a hose assembly with a fitting terminal end that has a performance rating lower than the hose rating. When ordering hose assemblies, please keep the terminal end performance rating in mind since this may affect overall hose assembly performance.

Many hose assembly components (hose and fittings) are easily assembled in the field. However, factory assembled swaged, crimped and reusable hose assemblies are available. For complete information, contact Eaton.

### MIXING/MATCHING

AEROQUIP FITTING TOLERANCES ARE ENGINEERED TO MATCH AEROQUIP HOSE TOLERANCES. THE USE OF AEROQUIP FITTINGS ON HOSE SUPPLIED BY OTHER MANUFACTURERS AND/OR THE USE OF AEROQUIP HOSE WITH FITTINGS SUPPLIED BY OTHER MANUFACTURERS MAY RESULT IN THE PRODUCTION OF UNRELIABLE AND UNSAFE HOSE ASSEMBLIES AND IS NEITHER RECOMMENDED NOR AUTHORIZED BY EATON.

EATON SHALL NOT BE SUBJECT TO AND DISCLAIM ANY OBLIGATIONS OR LIABILITIES (INCLUDING BUT NOT LIMITED TO ALL CON-

SEQUENTIAL, INCIDENTAL AND CONTINGENT DAMAGES) ARISING OUT OF BREACH OF CONTACT OR OF WARRANTY OR ARISING FROM TORT CLAIMS (INCLUDING WITHOUT LIMITATION NEGLIGENCE AND STRICT LIABILITY) OR OTHER THEORIES OF LAW WITH RESPECT TO ANY HOSE ASSEMBLIES NOT PRODUCED FROM GENUINE AEROQUIP HOSE FITTINGS, HOSE AND AEROQUIP APPROVED EQUIPMENT, AND IN CONFORMANCE WITH AEROQUIP PROCESS AND PRODUCT INSTRUCTIONS FOR EACH SPECIFIC HOSE ASSEMBLY.

FAILURE TO FOLLOW AEROQUIP PROCESS AND PRODUCT INSTRUCTIONS AND LIMITATIONS COULD LEAD TO PREMATURE HOSE ASSEMBLY FAILURES RESULTING IN PROPERTY DAMAGE, SERIOUS INJURY OR DEATH.

900705  
Steel protective coil sleeve

Recommended for use where hose lines are subjected to excessive abrasion, kinking or accidental damage. Construction: spring steel, rust resistant.

This coil should fit snugly to the hose O.D. expanding the coil I.D. (unwind the coil) may be necessary for proper installation.

FOR USE WITH HOSE:  
SEE PAGES 149-152.

## Protective Coils, Sleeves & Clamps

624 Firesleeve

Firesleeve will protect hose from direct flame. Firesleeve is constructed of a uniform single layer of braided fiber-glass tubing impregnated with flame resistant silicone rubber. Temperature range of -65°F to +500°F.

FOR USE WITH HOSE:  
SEE PAGES 149-152.

624-60	3.75	FF9217-0664C

FF9217 Firesleeve clamp

Recommended for attaching 624 Firesleeve to hose lines.

Clamp numbers:  
FF9217-0622S, FF9217-0648S;  
3/4 inch wide, FF9217-0664C;  
1 inch wide.

FOR USE WITH HOSE:  
SEE PAGES 149-152.

FC425 Nylon abrasion sleeve  
Meets MSHA requirements

Nylon sleeve protects hose from abrasion and allows bundling of hose lines.

FOR USE WITH HOSE:  
SEE PAGES 149-152.

PART NUMBER	NOMINAL SLEEVE I.D.* OBO (INCHES)
FC425-12	.71
FC425-15	.92
FC425-16	1.00
FC425-18	1.13

FC425-40	2.54
FC425-46	2.86
FC425-54	3.34
FC425-59	3.66

\* The maximum O.D. of hose fittings must be allowed for if fittings are to be covered.

### Hose Cleaning System

The Jetcleaner<sup>®</sup> hose cleaning system offers a revolutionary solution for the internal cleaning of bulk hose and finished hose assemblies. Using a low pressure air gun, the Jetcleaner system routes a foam projectile through the hose to thoroughly remove debris remaining from cutting, skiving and assembly operations. Available in kit form or as individual components, the Jetcleaner<sup>®</sup> hose cleaning system is the system of choice for hose assembly professionals.

### Hose Kit (P/N FT1355-0 1)

Includes:

Jetcleaner<sup>®</sup> pistol, Hose nozzles, 1/4" through 2" ID, Adapter ring, Bench stand, Aluminum case, Quick disconnect coupling

Note: FT1355-3-size Hose projectiles not included in kit.

Also available individually:

- FT1355-1-01 Jetcleaner<sup>®</sup> pistol
- FT1355-2-size Hose nozzles
- FT1355-3-size Hose projectiles
- FT1355-4-size Coupling nozzles
- FT1355-5-size Coupling projectiles
- FT1355-10-01 Adapter ring
- FT1355-11-02 Carrying case
- FT1355-12-0 Bench stand

# Assembly Equipment Hose Cut Off Equipment

## S1104 Hose cut-off machine

### Hose Specifications

- ¥ Single and Double Wire Reinforced, 1/2 to 3 O.D.
- ¥ Four and Six Spiral Wire Reinforced, 1/2 to 1 1/2 O.D. with optional blades FT1101E1 and FT1101E2, spiral wire capacity is increased to 20

### Features

- ¥ Compact, 22 1/2 x 24 1/2
- ¥ Light, 130 lbs.
- ¥ Dual V-belt drive
- ¥ 10 1/2 cutting blade
- ¥ U.L. listed

### Electrical Requirements

- ¥ 3 hp, 230/460V, 3 phase, 60 Hz.
- ¥ Machine wired for 230V AC. Change connections as

shown on motor plate for 460V. Also, replace 230V motor heater with 460V motor heater included with machine.

### Ordering Instructions

#### Machine:

- S1104 Basic machine, 230/460V, 3 phase, 60 Hz
- S1026 Hose measuring gauge attachment
- FT1215 Hose reel attachment
- S1118 Coolant spray system (required when cutting spiral wire hose)
- SC1709 10 1/2 Replacement cutting blade
- SC1772 Welded steel table

\*A 3 hp, 230V AC, single phase machine is also available but not recommended because of reduced torque and less capability when cutting larger size hose. Order by part number S1104-230.

### Optional Cutting Blades

#### FT1101E1

10" Scalloped Blade

#### FT1101E2

10 1/2 Abrasive Blade

## FT1260 Hose cut off machine

### Hose Specifications

- ¥ All Hose Constructions 1/4" to 4" I.D.

### Features

- ¥ Built in safety features
- ¥ Easy to operate
- ¥ 16" abrasive wheel
- ¥ Heavy duty design
- ¥ Low maintenance
- ¥ V shaped vise
- ¥ U.L. listed

### Ordering Instructions

#### Machine:

- FT1260E1E1 Base machine with stand. 230/460V, 3 phase, 60 Hz
- FT1260E1E2 Base machine with stand and fume exhauster. 230/460V, 3 phase 60 Hz
- FT1260E1E3 Base machine with stand. 230V, single phase, 60 Hz
- FT1260E1E4 Base machine with stand and fume exhauster. 230V, single phase, 60 Hz

FT1260E2E5 Optional hood (can be used only with the E1E2 and the E1E4 models) Aeroquip recommends the use of FT1260E2E5, optional hood

#### Replacement Components:

FT1260E3E1 Replacement 16" fiberglass reinforced abrasive wheel

#### Electrical Requirements

Electrical requirements will vary depending on options selected.

Contact Eaton for additional information.

# Assembly Equipment Hose Cut Off Equipment

S1120  
Hose preparation package

Hose Specifications

Cutting 1/2" to 3"

Skiving 1/2" to 2"

Features

- ¥ Fast, efficient hose cutting
- ¥ 10" cutting blade
- ¥ Easily adjusted, self-contained skiving mandrels for reusable fittings
- ¥ Safe collection of skived rubber
- ¥ Spray system prolongs blade life
- ¥ Rotary hose reel for easy hose handling
- ¥ 24" x 42" x 24" 240 lbs.
- ¥ Double V belt cutting drive
- ¥ Direct skiving drive

Electrical Requirements

3 hp (in S1102 machine saw),  
1/3 hp (in dust collector),  
230/460V AC, 60 Hz, 3 phase

Blade Selection

Eaton offers three different cutting blades to make cutting of wire braid and spiral wire hose quick and easy.

Ordering Instructions

The S1120 hose preparation package may be ordered as a complete assembly or the five different components of the package may be ordered individually.

S1120\* Hose Preparation Package

S1102\* Includes: Basic Cut Off and Skiving Machine

S1043\* Dust Collector and Table

S1026 Hose Measuring Gauge Attachment

FT1215 Hose Reel Attachment

S1118 Coolant Spray System

SC1681 (Optional) Replacement Skiving Brush

\*A 3 hp 230V AC single phase motor is also available but not recommended due to reduced torque and less capability in cutting larger size hose. The following part numbers must be used when ordering components with single phase motors:

S1120230 Hose Preparation Package

S1102230 Basic Cut Off and Skiving Machine

S1043230 Dust Collector and Table

SC1709  
Standard replacement cutting blade (one included with each machine)

FT1101E1  
Scalloped cutting blade (optional; used for cutting spiral wire hose)

FT1101E2  
Abrasive cutting blade (optional; used for cutting spiral wire hose)

# Assembly Equipment Reusable Assembly Equipment

## FT1013 Portable reusable hose assembly machine

### Fitting Specifications

- Fabric and single wire braid, -04 through -40
- Double wire and 4-spiral wire, -04 through -32

### Features

- Quick acting wrench type chuck
- Easy to operate
- Safety guard
- Versatile
- Safety snap type switch
- Safety footswitch
- 36 rpm
- 45" x 56" x 46", 170 lbs.

### Ordering Instructions

- |            |   |
|------------|---|
| FT1013-1-5 | Base machine, 110V, with vise                                     |
| FT1013-1-6 | Base machine, 220V, with vise                                     |
| FT1013-1-3 | Base machine, 110V, with stand, vise and socketing tool           |
| FT1013-1-4 | Base machine, 220V, with stand, vise and socketing tool           |
| FT1013-1-1 | Base machine, 110V, with tool kit, stand, vise and socketing tool |
| FT1013-1-2 | Base machine, 220V, with tool kit, stand, vise and socketing tool |
| FT1013-2-1 | Vise  |
| FT1013-2-2 | Stand   |
| 1562       | Tool kit  |
| FT1281     | Socketing tool (see below)  |

### Electrical Requirements

1/2 hp reversible, variable speed, universal motor; as the torque increases the speed decreases. 110V AC, single phase, 25-60 Hz, or 220V AC, single phase, 25-60 Hz

## FT1281 Socketing tool

For use with stand mounted FT1013 and FT1097 Portable Hose Assembly Machine. (The FT1281 socketing tool must be accompanied by the FT1097-2-1 vise kit (see page 000) when used on the FT1097 portable hose assembly machine).

# Assembly Equipment Reusable Assembly Equipment

FT1028  
Production reusable hose  
assembly machine

¥ 24Óx 62Óx 32Ó550 lbs.

Electrical Requirements

# Accessories & Equipment

## Assembly Equipment

FT1211  
Dogleg assembly machine

### Features

- ¥ Full set of jaw inserts to accommodate -3 through -48 size fittings
- ¥ Easy-to-use hand crank and angle locator for setting precise phase angles
- ¥ Built-in tolling storage cabinet
- ¥ Forward, reverse and neutral operation options
- ¥ Sturdy steel frame with bolt-down base
- ¥ Sliding guard for operator safety

### Specifications

Weight: 800 lbs. (without attachments)

Speed: 45 rpm

Motor: 1.5 hp

Spindle Thru-Hole: 7.75 inches

Power: Standard 115-volt, single phase, 60-Hz, 30-amp breaker required

### Part Numbers

FT1211A Base Machine (includes tooling for -3 through -48 size fittings)

FT1211-23 Faceplate (for straight captive flange fittings)

FT1229-No Stripping Tool

FT1230-No Stripping Tool

222070 Assembly Lube

FT1220E10  
Reusable fitting assembly mandrels

### Specifications

The FT1220E10 kit includes all assembly mandrels listed for E4 through E20 for the assembly of Aeroquip 411, 401, and 406 reusable hose fittings. Individual mandrels may also be ordered by using the part numbers to the right.

# Accessories & Equipment

## Assembly Equipment

### 1605 & 1606 Assembly Tool Kits

The 1605 and 1606 Assembly Tool Kits contain the 1583 assembly tool and accessory items necessary to assemble banded segment socket fittings. The 1605 Kit provides tooling for assembly of both 3 segment (sizes -20 thru -32) and 4 segment (sizes -40 and -64) fittings. The 1606 Kit provides tooling only for assembly of 3 segment fittings. Component parts may be ordered individually as needed.

### 1605 KIT (-20THRU -64 HOSE FITTINGS)

PART NO.	DESCRIPTION	QUANTITY
1583-64	Assembly Tool	1

### FT1229/FT1230 Hose Cover Stripping Tools

The Eaton Aeroquip FT1229 and FT1230 hose cover stripping tools are designed to remove the rubber cover from wire reinforced hose prior to attaching crimped or reusable fittings. The tools are designed for use either in a standard shop vise, lathe chuck, drill press, Aeroquip assembly machine or by hand.

The mandrels are color-coded for easy identification; FT1229 for reusable fittings silver cadmium plated, FT1230 for crimp fittings yellow chromate plated. Each tool is assembled and preset for the particular size hose. If desired, components may also be ordered separately.

# Accessories & Equipment Assembly Equipment

Hose assembly machines

## FT1212 and FT1222 Segmented Fitting Assembly Machine

The FT1212 Assembly Machine shown above provides fast, easy assembly of 3 segmented socket type fittings.

The FT1212 Assembly machine can be bench mounted or transported making it ideal for virtually every segmented socketed assembly operation.

The FT1222 Assembly Machine is also available for assembly of 4 segmented socket type fittings.

The unique design of the FT1222 assembly machine develops over 10 tons of force on each socket segment while exerting only minor forces on the frame.

The light weight, durability of the machine can be bench mounted or transported, making it ideal for segmented socket fitting assembly operations using Aerquip hose styles 150901 and 2662 in sizes -40, -48, and -64.

For more information contact Eaton.

## Components

1. Sturdy tubular steel frame
2. Single acting spring return cylinders
3. Pressure gauge
4. Pump
5. Electric foot switch
6. Locating pins
7. Adapter pads

# Assembly Equipment Hose Proof Stand

FT1312  
Hose proof test stand

Hose Specifications  
Assembles up to 2" I.D., 6  
spiral wire

Features

- ¥ Designed to use tap water, eliminating the need for a special test fluid
- ¥ Compact power unit is air driven
- ¥ Air regulator and gauge provide easy pressure adjustment and monitoring
- ¥ Tough transparent Lexan\* lid
- ¥ 79" x 36" x 53" 550 lbs.

Power Unit

The power unit of the FT1312 tester is a compact, economical air driven hydraulic pump. It will provide sufficient hydraulic pressure to proof test any Aeroquip hose assembly, up to 22,000 psi.

# Assembly Instructions

## Installation Instructions for 624 Firesleeve

The 624 Firesleeve is constructed of a single layer of braided fiberglass tubing impregnated with flame-resistant silicone rubber. The primary applications for

this sleeve are on hose assemblies conveying a flammable fluid in a system that could be exposed to a direct flame or to protect any hose passing through a high tem-

perature area. Typical applications include fuel and lube lines in USCG inspected ships. Numerous single wire braid hose styles (2651 for example) when covered with

624 firesleeve are deemed fire-resistant by the U.S. Coast Guard.

1. Follow the appropriate hose assembly instructions through the assembly of one end fitting. Cut firesleeve to same length as hose.

Using Firesleeve End Dip (AE13702-001), dip ends of firesleeve to a depth of three quarters of an inch and allow to dry at room temperature.

Start firesleeve over cut end of hose. Note: If applying sleeve over PTFE or stripped cover assemblies, wrap exposed wire with tape. Grasp sleeve and slip over the hose assembly, as illustrated.

2. Skin sleeve back from cut end of hose enough to allow assembly of second end fitting. (2A)

Then center sleeve so that it completely covers both sockets. (2B)

3. Insert tail of band clamp (FF9217-) (see page 000 for part number and dash size) into hand clamping tool.

4. Position band clamp over sleeve as shown and then draw tight with hand tool, F2636. Remove tool and cut free end of band clamp. Repeat on other end of assembly.

5. To complete, bend protruding tail of clamp over clamp buckle. Also, repair any scuffs or minor abrasions of firesleeve by brush application of End Dip AE 13702-001.

Clean, Inspect and Proof Test

CAUTION: Do Not Pass With Air Under Water.

Aeroquip End Dip  
Part Number AE13702-001

# Assembly Instructions

## Internal Support Coils, 222005, 222022, FF90505

### Step 1

Cut coil length. The coils should be cut to the hose length, minus the nipple intrusion. For any given hose assembly the support coil length equals the overall hose assembly length minus the sum of the overall lengths of each end fitting (O.D. dimensions).

Small size of the coil can usually be cut with strap cutters or sheet metal shears. The larger sizes are best cut with a heavy sharp chisel or bolt cutter. With small sizes, skip directly to Step 3.

### Step 2

Compress the coil (large sizes only). It is necessary to reduce the coil diameter slightly in order to insert it into the hose. The easiest approach is to use a length of pipe with a notch cut in one end. Clamp the plain end of the pipe in a vise, slide the coil over the pipe and insert the free end of the coil into the notched end of the pipe. Then clamp the coil and pipe firmly together. Twist the coil to compress it prior to installation into the hose.

### Step 3

Small sizes: The coil can be worked into the hose by hand without difficulty. Remove all burrs from the coil prior to insertion. This will prevent cutting of the hose tube. Position the coil mid-way between hose ends.

Large sizes: With the pipe still in position, as in Step 2, assemble the hose over the coil. With the coil fully centered in the hose, remove the pipe and clamp.

Recommended for vacuum service with nitrile hose. 222005, 222022-C are stainless steel.

# Assembly Instructions

## Installation Instructions for Internal Support Sleeve FF9700

1. Cut hose to required length and assemble one end fitting.
2. On the remaining fitting, measure the distance from the end of the nipple to the nipple shoulder, add 1/4" to this dimension and mark this distance on the inside of the hose.

3. Install internal support sleeves up to, but not past the mark and no more than 3/8" below the mark.
4. Measure the distance from the end of the last sleeve section to the mark. If this dimension is greater than 3/8", one or possibly two sleeves must be cut to obtain the optimum supported length within the hose.

5. One Sleeve Cut
  - a. Cut sections of sleeve must contain at least two bronze rings. If the sleeve section needed is greater than 3/8" in the dimension chart, make a clean, straight cut in the area between the rib indicators where stenciling is present (with a hacksaw or band saw).
  - b. Make sure the cut section is free of foreign particles and rubber dust.

6. Two Sleeve Cuts
  - a. If the cut section needed is less than dimension 3/8" add the measured distance in Step 4 to the length of one sleeve, and make cuts in two sleeves so their total length will equal this distance. Remember, neither cut section can be less than dimension 3/8" because no cut section should contain less than two bronze rings. Cuts must be made between the rib indicators where stenciling is present.
  - b. Complete the installation following 3/8" and 3/8" in Step 5.
7. Assemble the other end fitting to the hose.

- c. Make sure a full sleeve is at each end of the hose assembly by placing the cut section below the last full section installed in the hose.

# Assembly Instructions

## Stripping the Cover for Hose FC162, FC163, AE373, AE371

1. By Hand: break off and grind smooth the blade of a leather knife as shown. Grind notch where blade enters handle and sharpen rear edge of notch. Keep knife sharp for easy stripping.

2. Use notch on socket to determine length of cover to be stripped.

3. Cut around hose through cover to wire braid. Use sharpened rear edge of knife as shown.

4. Slit cover lengthwise. Be sure cut is down to wire braid.

5. Working clockwise, pry up cover as shown (A), twist off cover with pliers (B).

Option Step 3A, 4A, 5A.  
Skive Tool:  
Use the correct size Eaton Aeroquip FT1229 hose cover skiving tool. Mount the tool in a vise. Push the hose over the mandrel. Rotate the hose clockwise until it bottoms or secure hose in a vise and attach FT1279 auger to the skive tool. Insert mandrel into the hose and rotate clockwise until it bottoms.

Option Step 3B, 4B, 5B.  
Machine:  
Use the Eaton Aeroquip S1102 cut-off and skiving machine. Consult the owners manual. Select the correct mandrel. Turn on the machine. Put the hose over the mandrel and rotate.

# Assembly Instructions

## Hose 2556, 2565

To determine  $L$  length (length of hose): from  $OA$  length (overall length) deduct  $D$  dimensions of both end fittings and add 1/2 inch, as the hose tends to shorten when fittings are inserted.

### Assembly

1. Cut hose to required length with a sharp knife. Oil inside of hose and outside of nipple liberally. Use Aeroquip 222070 hose assembly lube or heavy oil.

Note: Where oil cannot be used for lubrication, a liquid soap may be used.

2. Tighten nipple in vise as shown. Push hose on fitting until hose end bottoms underneath protective cap. For quantity production use an Aeroquip Socketless fitting assembly machine. Clean, Inspect and Proof Test.

### Disassembly

3. With a sharp knife, slit hose lengthwise from protective cap to end of nipple. Be careful not to damage the nipple.

4. Bend hose, then snap hose off with a quick tug.

### Hose Assembly Lube

A specially compounded lubricant superior to any other lubricant used in hose assembly work. Available in pints or gallons.

Use for either hand or machine assembly.

NOTE: Not to be used with green cover fire resistant hydraulic fluid hoses.

Part Numbers: pint 222070,  
gallon 222070-8.

# Assembly Instructions

Hose FC234,  
AE372, 302A,  
303, AE369,  
AE370

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely to desired length using a high speed abrasive wheel or steel cut off wheel. Hose may also be cut with a fine toothed hacksaw or an Aeroquip Cut-off Machine (S1104, FT1260, S1120, page 153-154). Hose should be bent so that the outside of the bend contacts the wheel to prevent binding. Do not feed the hose to the cutting edge too fast as it may tend to loosen the wire reinforcement or cause unraveling. After the cutting operation is complete, thoroughly clean all residue from the inside and outside of the hose.

If cutting the hose has caused the end to neck down slightly, it can be flared with a smooth tool to allow proper insertion of the nipple.

2. Apply thin coat of end sealing compound to the ends and to the cover which will be covered by the fitting socket, and allow to dry for about 1/2 hour. Do not allow end sealant to enter hose bore.

Immediately before installing socket, apply a second thin coat of end sealing compound over the first thin coat.

3. Put fitting socket in vise and screw hose counterclockwise into the socket until hose bottoms, then back off 1/4 turn.

4. Oil nipple threads and inside of hose liberally with a petroleum base oil such as Aeroquip LUBE 222070. Use Molykote Gn Paste

5. a. For male end fittings insert assembly mandrel into nipple. Screw nipple clockwise into socket. Tighten nipple to within 1/32" to 1/16" of the socket. Do not tighten against socket.  
b. For swivel end fittings (Aeroquip styles 401 and 411) insert mandrel into nipple and tighten nut onto mandrel. Screw nipple into socket and hose clockwise using wrench on assembly mandrel hex. Leave 1/32" to 1/16" clearance between nut and socket so that nut can swivel freely.

NOTE: An assembly mandrel is required (see page 000) for all single wire braid hose in sizes 1/4" through 3/4" except when 4400 series fittings are used. For sizes 1" and larger using adapter to provide a hex surface for screwing the nipple into the hose and socket.

6. Remove assembly mandrel and add a fillet of sealing compound to hose end of socket. Clean, Inspect, and Proof Test.

INSTRUCTIONS FOR ASSEMBLY OF MONEL AND STAINLESS STEEL FITTINGS, see page 000.

# Assembly Instructions

## 2580 Hose and Fittings -4 thru -32 with Standard Reusable Fittings

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose square with knife or cut-off wheel. Clean hose bore. Put socket in vise and screw hose counterclockwise into socket until it bottoms. Back off 1/4 turn.

2. Oil nipple threads, assembly tool mandrel, and inside of hose **LIBERALLY**. Use heavy oil or Aeroquip Lube Oil.

3. **MALE ENDS:** Push assembly tool into nipple. Oil. Screw nipple clockwise into socket and hose. Tighten nipple leaving 1/32" to 1/16" clearance between nipple hex and socket.

**SWIVEL ENDS:** Tighten nipple and nut on assembly tool. Oil. Screw nipple clockwise into socket and hose. Leave 1/32" to 1/16" clearance between nut and socket.

# Assembly Instructions

## Attaching the fitting for Hose 2766, FC162, FC163, AE373, AE371

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely to desired length using a high speed abrasive wheel or steel cut off wheel. Hose may also be cut with a fine toothed hacksaw or an Aeroquip Cut-off Machine (S1104, FT1260, S1120 page 153-154). Hose should be bent so that the outside of the bend contacts the wheel to prevent binding. Do not feed the hose to the cutting edge too fast as it may tend to loosen the wire reinforcement or cause unraveling. After the cutting operation is complete, clean all residue from the inside and outside of the hose.

If cutting the hose has caused the end to neck down slightly, it can be flared with a smooth tool to allow proper insertion of the nipple.

2. Strip off Cover (see page 164)

3. Apply coating of sealing compound to ends of hose and to skived portion to cover all exposed wire surfaces and wire ends, and allow to dry for about one half hour. Do not allow end sealant to enter hose bore. Immediately before installing socket, apply a second coat of sealing compound over the first coat.

4. For multiple wire braid reinforced hose, except sizes -16, -24, -32 (FC163, AE371) place fitting socket in a vise and screw hose counter-clockwise into the end of socket until it bottoms.

For spiral reinforced hose and multiple wire braid reinforced hose, sizes -16, -24, and -32, place hose in vise and push socket onto it while rocking and twisting socket until it bottoms onto the hose. After starting the socket onto the hose it may be tapped on with a rawhide or lead hammer to avoid damage to the threads.

5. Oil nipple threads and inside of hose liberally with a petroleum base oil such as Aeroquip LUBE 222070. Use Molykote Type G for monel fittings.

6. Screw nipple clockwise into socket and hose. Leave a  $\frac{1}{32}$ " to  $\frac{1}{16}$ " clearance between the nipple hex and the socket. Place a fillet of sealing compound around the hose end of the socket and the hose.

# Assembly Instructions

## For PTFE Hose Ø 2807, 2808

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

### To Assemble

1. Wrap hose with masking tape at cut-off point and cut squarely to length through taped area using a high speed abrasive wheel, a sharp cut-off wheel or a fine toothed hacksaw. Remove tape and trim any loose wires flush with tube stock. Any burrs on the bore of the tube stock should be removed with a knife. Sometimes wire braid will tend to "neck down" on one end and "flare out" on the opposite end. This is characteristic of wire braid hose and can be used to an advantage in the assembly of the fittings. Slip two sockets back-to-back over the "necked down" end of hose, positioned approximately 3 inches from each end.
2. Grip nipple hex in a vise. Work the hose bore over the nipple to size the tube and aid in separating the braid prior to inserting the sleeve. Remove hose from nipple.
3. Push the sleeve over the end of the inner tube and under the wire braid by hand. Complete positioning of the sleeve by pushing the hose end against a flat surface. Visually inspect to see that the tube stock butts against the inside shoulder of the sleeve. Set the sleeve barbs into the PTFE tube by pushing a tapered punch into the end of the sleeve and tube. This step can be facilitated by using Aeroquip PTFE Hose Assembly Tool Kit Part Number FT1081.

# Assembly Instructions

For hose assemblies with band type Segmented Socket Fittings  $\text{\textcircled{D}}$  for Hose AE370, AE374, 150901

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely to desired length using a high speed abrasive wheel or steel cut off wheel. Hose may also be cut with a fine toothed hacksaw or an Aeroquip Cut-off Machine (S1104, FT1260, S1120) **page 153-154** hose should be bent so that the outside of the bend contacts the wheel to prevent binding. Do not feed the hose to the cutting edge too fast as it may tend to loosen the wire reinforcement or cause unraveling. After the cutting operation is complete, clean all residue from the inside and outside of the hose.  
If cutting the hose has caused the end to neck down slightly, it must be flared out to allow proper insertion of the nipple. An open end wrench can be used to flare the hose out.

2. Apply thin coat of end sealing compound to the hose ends and to the outer cover which will be covered by the fitting socket, and allow to dry for about 1/2 hour. Immediately before installing nipple, apply a second thin coat of end sealing compound over the first thin coat. Do not allow end sealant to enter hose bore.

3. Place retaining ring over nipple and segment band over hose. In case of flanged ends, be sure the flange is in place on the nipple before putting retaining ring on and inserting nipple into hose. Push nipple all the way into hose until stopped by nipple shoulder.

4. Hook socket segments into retaining ring and space segments evenly around hose. Place assembly tool around segments so the locating pins of the tool fit the corresponding hoses in each segment. Make sure locating pins are tight in assembly tool before proceeding.

b. The convex inner surface of the band must seat squarely into the grooves of the segments. Do not compress segments more than necessary to slip the securing band in place over the segments. If necessary, the band may be tapped lightly into place with a plastic or rubber mallet.

5. a. Alternately and uniformly tighten the nuts on assembly tool until the segment securing band slips over the end of the segments.

When securing band is properly seated around segments, loosen nuts and remove tool.

Add a fillet of end seal where the hose extends out of the fitting.

Clean, Inspect and Proof Test.

# Assembly Instructions

## FC132 Hose and Fittings

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely to length using a sharp knife or cut off saw. Hose should be bent slightly away from the cutting edge to prevent binding. A water soluble oil may be used to cool the blade. Clean hose bore.
2. Insert the nipple into the hose until the hose bottoms squarely against the nipple shoulder. Apply a light coat of lubricant to the exterior cover at both ends of the hose, covering the last 5 inches of each end.

3. Place the shoulder of each segment into the nipple assembly as shown.

4. Insert the 4 bolts through the matching segment holes. Lubricate bolt threads with a light coat of Molykote Type GN Paste or similar molybdenum disulfide lubricant. Start the nuts, and holding the segment parallel, tighten the bolts alternately keeping gaps between segments equal, until the segment stops meet, or torque values listed below are reached, whichever occurs first.

Torque Values: -40 80 to 90 Ft. lbs., -48 120 100 RPM, to 130 Ft. lbs., -64 170 to 180 Ft. lbs. NOTE preferred speeds are 40 to 50 RPM. It is recommended to re-torque bolts after proof testing.

### INSTRUCTIONS FOR ASSEMBLY OF MONEL AND STAINLESS STEEL FITTINGS

The best assembly lubricant for these two materials is Molykote GN paste\*. This Molybdenum disulfide lubricant performs best when applied full strength, per the manufacturer's instructions on the label. Minimal heat will be generated during assembly or disassembly when the following steps are followed:

1. Apply Molykote GN paste to all threaded surfaces every time the components are assembled.
2. Assemble and disassemble in a continuous motion.
3. Avoid side loading during assembly or disassembly.
4. Speeds should not exceed

\*Trademark of Dow Corning Corporation.

# Assembly Instructions

## 2580 Hose and Fittings -80 thru -192 with Bolt Type End Fittings

To determine "J" length (cut length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely with a sharp cut off wheel. Hose should be bent slightly away from the cutting edge to prevent binding. A water soluble oil may be used to cool the blade. Clean hose bore.
2. When slip-over components (flanges, etc.) are used, assemble these to the nipple first. Lubricate the nipple liberally with Aero Lube. Push the hose onto the nipple until the hose bottoms squarely against the nipple shoulder.
3. Place the socket segments around the hose at the nipple area. Lubricate the bolts with Molykote GN Paste. Washers must be used on the nuts.
4. Align the segment shoulders with the nipple groove. Tighten the segments uniformly until the segment bosses make contact with the adjoining segment.

# Assembly Instructions

## For hose assemblies with steel or bronze Bolt Together Segmented Socket Fittings $\bar{D}$ For Hose 2758

To determine "J" length (length of hose): from "OA" (overall length) deduct "D" dimensions of both end fittings.

1. Cut hose squarely to desired length using a high speed abrasive wheel or steel cut off wheel. Hose may also be cut with a fine toothed hacksaw or an Aeroquip Cut-off Machine (S1104, FT1260, S112C page 153-154). Hose should be bent so that the outside of the bend contacts the wheel to prevent binding. Do not feed the hose to the cutting edge too fast as it may tend to loosen the wire reinforcement or cause unraveling. After the cutting operation is complete, clean all residue from the inside and outside of the hose.

If cutting the hose has caused the end to neck down slightly, it can be flared with a smooth tool to allow proper insertion of the nipple.

2. Apply thin coat of end sealing compound to the hose ends and to the outer cover which will be covered by the fitting socket, and allow to dry for about 1/2 hour. Do not allow end sealant to enter hose bore. Immediately before installing nipple, apply a second thin coat of end sealing compound over the first thin coat.

3. Place retaining ring over nipple and push hose onto nipple until it bottoms squarely on the shoulder of the nipple. In case of flanged ends, be sure the flange is in place on the nipple before putting retaining ring on and inserting into hose.

4. Hook segments into retaining ring and space them evenly around hose. In the case of the bronze segments (-80 and -96) be sure that the letter "R" is stamped on each segment. (This indicates that the parts have been radiographed).

5. a. Using only K-monel bolts and nuts, and beryllium copper washers, place washers under heads of bolts. Lubricate the bolts with Molykote Type GN Paste or equivalent and insert into holes so all face the same direction. For bronze segment sockets in the -80 and -90 sizes, belled washers are used; see page 107 for part numbers. When assembling, convex surfaces of belled washers should be against bolt head and nut.

Note: New bolts and nuts should always be used for each reassembly.

6. Recheck all spacing and then tighten nuts uniformly, working around the fitting four or five times until the sides of the adjacent segments are parallel to each other, however, the adjacent segments may be 1/8 inch wider at the bolt center line than at the ring.

## Assembly Tips

### Terms

- Skive—Strip, as to strip-off a thin layer of cover material.
- Dash Size—The hose or fitting size expressed in  $\frac{1}{16}$  of an inch. The numerator of a fraction whose denominator is 16. Example: -8 or -08 is  $\frac{8}{16}$  =  $\frac{1}{2}$ ".
- Nipple—The part of a hose fitting that goes into the hose tube.
- Socket—The part of a hose fitting that goes over the hose cover or reinforcement.
- Mandrel—A round, properly sized, steel bar used for support during assembly of the fitting or skiving the hose cover.

### Reusable fitting tips to remember for easy assembly

- Part numbers and dash sizes are indicated on fitting sockets.
- It is essential the fitting be mated with a compatible hose style with the same dash size.
- Reusable fittings that have a notch in the socket serve as a reference for the cover skiving length.
- Familiarize yourself with the assembly instructions before you start to make an assembly.
- For hoses that require skiving, be sure to skive the hose to the proper length and down to the wire reinforcement.
- Use Eaton Aeroquip 222070 hose assembly lube liberally on both the inside of hose and on the fitting nipple (Check for compatibility).
- Always cut hose square by using a sharp instrument
- For volume production of hose assemblies, use Aeroquip Assembly Equipment.

### Cutting the hose

1. To determine the "J" length (cut length of hose) from "OA" (overall length) deduct "D" dimensions of both end fittings. Consult reusable fitting information pages for "D" dimensions. For hose assemblies with SOCKETLESS® fittings, add  $\frac{1}{2}$ " to "J" length. Tip: If the old Aeroquip assembly was the right length, simply remove the hose fittings and measure the hose.
2. Cut the hose square.
3. Clean the hose bore. Blow out shavings with shop air, flush with a solvent compatible with the hose or use a low pressure air gun. The Jetcleaner™ system routes a foam projectile through the hose to thoroughly remove the debris remaining from cutting and skiving operations. Caution: Follow proper safety procedures.

### Phase angle (offset)

When making double elbow assemblies, the following steps should be followed to obtain the desired angle between elbows. Tighten both elbows to maximum allowable gap between socket and nipple hex. Start to position for relative angle between elbows. Finish assembly by adjusting both elbows. Backing off to get desired angle should be avoided.

# Technical Data

## Fluid Compatibility

This chart indicates the suitability of various elastomers and metals for use with fluids to be conveyed. It is intended as a guide only and is not a guarantee. Final selection of the proper hose style, seal, or material of metal components is further dependent on many factors including pressure, fluid and ambient temperature, concentration, duration of exposure, etc.

### HOW TO USE THE CHART

1. The chart has separate sections for rating elastomers for use as hose inner tubes and as seals. Ratings for a given elastomer may not always be the same in both sections.
2. Both the elastomer and the metal must be considered when determining suitability of a combination for a hose assembly, adapter with O-Ring, swivel joint or coupling.
3. Locate the fluid to be conveyed and determine the suitability of the elastomeric and metal components according to the resistance ratings shown for each.
4. Specific hose part numbers can be found under the inner tube material groupings in the Hose Tube Identification Chart below.
5. Dimensional and operating specifications for each hose can be found on the catalog pages shown with each hose part number.
6. Information on O-Rings and seal options are shown in the respective sections of this catalog.

7. For further details on the products shown in this catalog, and their applications, contact Eaton.

### RESISTANCE RATING KEY

- E = Excellent – Fluid has little or no effect.  
 G = Good – Fluid has minor to moderate effect.  
 C = Conditional – Service conditions should be described to Eaton for determination of suitability for application.  
 U = UNSATISFACTORY

The differences between ratings "E" and "G" are relative. Both indicate satisfactory service. Where there is a choice, the materials rated "E" may be expected to give better or longer service than those rated "G".

**NOTE:** Special precautions are necessary in gaseous applications due to the potential volume of gaseous fluid in the system. Unless the cover is perforated, hose styles with rubber or thermoplastic covers are not suitable for gases above 250 psi. Hose styles with perforated covers are so noted in their construction descriptions.

# Technical Data

## Fluid Compatibility

### Hydraulic fluids & lubricating oils

The following is a representative list of fluids and manufacturers. The fluids are grouped under generic "family" heads and arranged alphabetically. For each generic "family" listing, we have included maximum fluid temperature recommendations for the five hose classifications on **page 176** (1 through 5). Two maximum fluid temperature ratings are listed under designations of "H" and "LP".

The "H" designation is for hydraulic service up to the maximum rated operating pressure of any particular hose in the classification. The "LP" designation is for low-pressure service such as lubricating oil systems or low-pressure hydraulic return lines.

The letter "U" in the box indicates unsatisfactory resistance to the fluid type.

Fluid temperature ratings are predicated on maximum allowable ambient temperatures as follows:

### Classifications 1 and 3 (Synthetic Rubber and Thermoplastic Elastomer)

"H" fluid temperature ratings:  
+140°F ambient

"LP" fluid temperature ratings:  
+180°F ambient

### Classification 2 (PTFE)

"H" fluid temperature ratings:  
+400°F ambient

"LP" fluid temperature ratings:  
+400°F ambient

### Classification 4 (AQP)

"H" fluid temperature ratings:  
+160°F ambient

"LP" fluid temperature ratings:  
+250°F ambient

(If "H" fluid temperature is +225°F or less, allowable ambient temperature may be increased to +200°F)

Ambient temperatures in excess of those recommended, in conjunction with maximum fluid temperatures, can materially shorten the service life of the hose.

CAUTION: The fluid manufacturer's recom-

# Technical Data

## SAE Recommended Practice

**Selection, installation and maintenance of hose and assemblies Ñ SAE J1273 November 1991**

### SAE recommended practice

The following recommendations on selection, installation and maintenance of hose assemblies were established by the S.A.E. in 1991. Please read these general instructions carefully. More detailed information on many of these subjects is covered in this catalog.

1. Scope—Hose (also includes hose assemblies) has a finite life and there are a number of factors which will reduce its life.

This recommended practice is intended as a guide to assist system designers and/or users in the selection, installation and maintenance of hose.

The designers and users must make a systematic review of each application and then select, install and maintain the hose to fulfill the requirements of the application.

The following are general guidelines and are not necessarily a complete list.

**WARNING: IMPROPER SELECTION, INSTALLATION OR MAINTENANCE MAY RESULT IN PREMATURE FAILURES, BODILY INJURY OR PROPERTY DAMAGE.**

### 2. References

2.1 Applicable Documents—The following publications form a part of this specification to the extent specified herein. The latest issue of SAE publications shall apply.

2.1.1 SAE PUBLICATIONS—Available from SAE, 400 Commonwealth Drive, Warrendale, PA 15096-0001.

J516—Hydraulic  
Hose Fittings

J517—Hydraulic Hose

3. Selection—The following is a list of factors which must be considered before final hose selection can be made.

3.1 Pressure—After determining the system pressure, hose selection must be made so that the recommended maximum operating pressure is equal to or greater than the system pressure. Surge pressures higher than the maximum operating pressure will shorten hose life and must be taken into account by the hydraulic designer.

3.2 Suction—Hoses used for suction applications must be selected to ensure the hose will withstand the negative pressure of the system.

3.3 Temperature—Care must be taken to ensure that fluid and ambient temperatures, both static and transient, do not exceed the limitations of the hose. Special care must be taken when routing near hot manifolds.

3.4 Fluid Compatibility—Hose selection must assure compatibility of the hose tube, cover and fittings with the fluid used. Additional caution must be observed in hose selection for gaseous applications.

3.5 Size—Transmission of power by means of pressurized fluid varies with pressure and rate of flow. The size of the components must be adequate to keep pressure losses to a minimum and avoid damage to the hose due to heat generation or excessive turbulence.

3.6 Routing—Attention must be given to optimum routing to minimize inherent problems.

3.7 Environment—Care must be taken to insure that the hose and fittings are either compatible with or protected from the environment to which they are exposed. Environmental conditions such as ultraviolet light, ozone, salt water, chemicals and air pollutants can cause degradation

and premature failure and, therefore, must be considered.

3.8 Mechanical Loads—External forces can significantly reduce hose life. Mechanical loads which must be considered include excessive flexing, twist, kinking, tensile or side loads, bend radius and vibration. Use of swivel-type fittings or adapters may be required to insure no twist is put into the hose. Unusual applications may require special testing prior to hose selection.

3.9 Abrasion—While hose is designed with a reasonable level of abrasion resistance, care must be taken to protect the hose from excessive abrasion which can result in erosion, snagging and cutting of the hose cover. Exposure of the reinforcement will significantly accelerate hose failure.

3.10 Proper End Fitting—Care must be taken to ensure proper compatibility exists between the hose and coupling selected based on the manufacturer's recommendations substantiated by testing to industry standards such as SAE J517. End fitting components from one manufacturer are usually not compatible with end fitting components supplied by another manufacturer (i.e., using a hose fitting nipple from one manufacturer with a hose socket from another manufacturer). It is the responsibility of the fabricator to consult the manufacturer's written instructions or the manufacturer directly for proper end fitting componentry.

3.11 Length—When establishing proper hose length, motion absorption, hose length changes due to pressure, as well as hose and machine tolerances, must be considered.

3.12 Specifications and

Standards—When selecting hose, government, industry and manufacturers' specifications and recommendations must be reviewed as applicable.

3.13 Hose Cleanliness—Hose components vary in cleanliness levels. Care must be taken to ensure that the assemblies selected have an adequate level of cleanliness for the application.

3.14 Electrical Conductivity—Certain applications require that hose be nonconductive to prevent electrical current flow. Other applications require the hose to be sufficiently conductive to drain off static electricity. Hose and fittings must be chosen with these needs in mind.

4. Installation—After selection of proper hose, the following factors must be considered by the installer.

4.1 Pre-Installation Inspection—Prior to installation, a careful examination of the hose must be performed. All components must be checked for correct style, size and length. In addition, the hose must be examined for cleanliness, I.D. obstructions, blisters, loose cover, or any other visible defects.

4.2 Follow Manufacturers' Assembly Instructions—Hose assemblies may be fabricated by the manufacturer, an agent for or customer of the manufacturer or by the user. Fabrication of permanently attached fittings to hydraulic hose requires specialized assembly equipment. Field-attachable fittings (screw style and segment clamp style) can usually be assembled without specialized equipment although many manufacturers provide equipment to assist in the operation.

SAE J517 hose from one manufacturer is usually not com-

# Technical Data

## SAE Recommended Practice

patible with SAE J516 fittings supplied by another manufacturer. It is the responsibility of the fabricator to consult the manufacturer's written assembly instructions or the manufacturer's written instructions directly before intermixing hose and fittings from two manufacturers. Similarly, assembly equipment from one manufacturer is usually not interchangeable with that of another manufacturer. It is the responsibility of the fabricator to consult the manufacturer's written instructions or the manufacturer directly for proper assembly equipment. Always follow the manufacturer's instructions for proper preparation and fabrication of hose assemblies.

**4.3 Minimum Bend Radius—**Installation at less than minimum bend radius may significantly reduce hose life. Particular attention must be given to preclude sharp bending at the hose/fitting juncture.

**4.4 Twist Angle and Orientation—**Hose installations must be such that relative motion of machine components produces bending of the hose rather than twisting.

**4.5 Securement—**In many applications, it may be necessary to restrain, protect or guide the hose to protect it from damage by unnecessary flexing, pressure surges and contact with other mechanical components. Care must be taken to insure such restraints do not introduce additional stress or wear points.

**4.6 Proper Connection of Ports—**Proper physical installation of the hose requires a correctly installed port connection while insuring that no twist or torque is put into the hose.

**4.7 Avoid External Damage—**Proper installation is not complete without ensuring that tensile loads, side loads, kinking, flattening, potential abrasion, thread damage, or damage to sealing surfaces are corrected or eliminated.

**4.8 System Check Out—**After completing the installation, all air entrapment must be eliminated and the system pressurized to the maximum system pressure and checked for proper function and freedom from leaks.

**NOTE: Avoid potential hazardous areas while testing.**

**5. Maintenance—**Even with proper selection and installation, hose life may be significantly reduced without a continuing maintenance program. Frequency should be determined by the severity of the application and risk potential. A maintenance program should include the following as a minimum.

**5.1 Hose Storage—**Hose products in storage can be affected adversely by temperature, humidity, ozone, sunlight, oils, solvents, corrosive liquids and fumes, insects, rodents and radioactive materials. Storage areas should be relatively cool and dark and free of dust, dirt, dampness and mildew.

**5.2 Visual Inspection—**Any of the following conditions requires replacement of the hose:

- (a) Leaks at fitting or in hose (leaking fluid is a fire hazard)
- (b) Damaged, cut or abraded cover (any reinforcement exposed)
- (c) Kinked, crushed, flattened or twisted hose
- (d) Hard, stiff, heat cracked or charred hose
- (e) Blistered, soft, degraded or loose cover
- (f) Cracked, damaged or badly corroded fittings
- (g) Fitting slippage on hose

**5.3 Visual Inspection—**The following items must be tightened, repaired or replaced as required:

- (a) Leaking port conditions
- (b) Clamps, guards, shields
- (c) Remove excessive dirt buildup
- (d) System fluid level, fluid type, and any air entrapment

**5.4 Functional Test—**Operate the system at maximum operating pressure and check for possible malfunctions and freedom from leaks.

**NOTE: Avoid potential hazardous areas while testing.**

**5.5 Replacement Intervals—**Specific replacement intervals must be considered based on previous service life, government or industry recommendations, or when failures could result in unacceptable down time, damage or injury risk.

## Flow Capacities

### Pressure Drop

#### Flow capacities of hose assemblies at suggested flow velocities

The chart below is designed and provided as an aid in the determination of the correct hose size.

#### Example:

At 13 U.S. gallons per minute, what is proper hose size within the suggested velocity range for pressure lines?

#### Solution:

Locate 13 U.S. gallons per minute in the left hand column and 10 feet per second in the right hand column (the center of the suggested velocity range for pressure lines). Lay a straightedge across the two points. The inside diameter is shown in the center column nearest the straightedge.

For suction hose, follow the same procedure except use suggested velocity range for pump inlet lines in the right hand column.

#### Based on Formula

$$\text{AREA (SQ. IN.)} = \frac{\text{G.P.M.} \times 0.3208}{\text{VELOCITY (FT./SEC.)}}$$

\*Suggestions are for oils having a maximum viscosity of 315 S.S.U. at +100°F (+38°C) and operating at temperatures between +65°F and +155°F (+54°C to +69°C). Under certain conditions, velocities in pressure lines can be increased up to 25 feet per second. Contact Eaton with specific information on your application.

#### To convert

U.S. gallons into Imperial gallons multiply U.S. gallons by 0.83267. Imperial gallons into U.S. gallons multiply Imperial gallons by 1.20095.

U.S. gallons to litres multiply by 3.785. Litres to U.S. gallons, multiply by 0.2642.

# Technical Data

## Service Life Routing/ Installation

### Hose routing and installation

Under pressure, a hose may change in length. Always provide some slack in the hose to allow for this shortening or elongation (However, excessive slack in hose lines may cause poor appearance).

If a hose is installed with a twist in it, operating pressures tend to force it straight. This can loosen the fitting nut. Twisting can cause reinforcement separation and the hose could burst at the point of strain.

When hose lines pass near an exhaust manifold or other heat source, they should be insulated by a heat resistant boot, firesleeve or a metal baffle. In any application, brackets and clamps keep hoses in place and reduce abrasion. For installations where abrasion to hose cover cannot be prevented with the use of clamps or brackets, a steel protective coil or abrasion resistant sleeve should be placed over the hose.

At bends, provide sufficient hose so that it does not have a bend radius less than its recommended minimum bend radius. Too tight a bend may kink the hose and restrict or stop the fluid flow. In many cases the proper use of adapters and hose fittings can eliminate tight bends or kinks.

In applications where there is considerable vibration or flexing, allow additional hose length. The metal hose fittings, of course, are not flexible, and proper installation protects metal parts from undue stress, and avoids kinks in the hose.

When 90° adapters were used, this assembly became neater-looking and easier to inspect and maintain. It uses less hose, too!

# Technical Data

## Cleaning, Inspection, Testing, and Storage

Clean

Inspect

Proof test-hydrostatic

Proof test-pneumatic

### Maintenance

Hose assemblies in operation should be inspected frequently for leakage, kinking, abrasion, corrosion or any other signs of wear or damage. Worn or damaged hose assemblies should be replaced immediately.

### Clean

Clean assembly by blowing out with clean compressed air. Assemblies may be rinsed out with mineral spirits if the tube stock is compatible with oil, otherwise hot water at +150°F max. may be used. Consult Eaton for special cleaning equipment.

### Inspect

Examine hose assembly internally for cut or bulged tube, obstructions and cleanliness. For segment style fittings, be sure that the hose butts up against the nipple shoulder; band and retaining ring are properly set and tight, and segments are properly spaced. Check for proper gap between nut and socket or hex and socket. Nuts should swivel freely. Check the layline of the hose to be sure that the assembly is not twisted. Cap the ends of the hose with plastic covers to keep clean.

### Proof test (hydrostatic)

The hose assembly should be hydrostatically tested at twice the recommended working pressure of the hose.

Test pressure should be held for no less than 1 minute and no more than 5 minutes. When test pressure is reached, visually inspect hose assembly for:

- a) Any leaks or signs of weakness.
- b) Any movement of the hose fitting in relation to the hose. Any of these defects are cause for rejection.

### Caution:

Testing should be conducted in approved test stands with adequate guards to protect the operator.

(See Assembly Equipment Section for Eaton Aeroquip Proof Test Stands.)

### Proof test (pneumatic)

Hose assemblies intended for gas or air service should be tested with air or nitrogen at 100 psi with the assembly immersed in water. Random bubbles may appear over the hose and fitting area when assembly is first pressurized. This should not be construed as a defect. However, if the bubbles persist in forming at a steady rate at any particular point on the hose, the assembly should be rejected.

### Caution:

Testing should be conducted in approved test stands with adequate guards to protect the operator.

### Storage and handling

Hose should be stored in a dark, dry atmosphere away from electrical equipment, and the temperature should not exceed +90°F. Storage in the original shipping container is preferred.

# Technical Data

## Analyzing Failures

Everyone in maintenance encounters hose failures. Normally, there is no problem. The hose is replaced and the equipment goes back in operation. Occasionally, the failures come too frequently – the same equipment with the same problems keep popping up. At this point the task is to determine and correct the cause of these repeated failures.

### Improper application

Beginning with the most obvious, the most common cause of hose failures – improper application – compare the hose specifications with the requirements of the application.

Pay particular attention to the following areas:

1. The maximum operating pressure of the hose.
2. The recommended temperature range of the hose.
3. Whether the hose is rated for vacuum service.
4. The fluid compatibility of the hose.

Check all of these areas against the requirements of the application. If they don't match up, you need to select another hose. It's a good idea at this point to call on your local hose distributor for assistance in selecting the proper hose. Eaton's distributors, for example, are well equipped to perform this service for you.

Distributor personnel attend special training courses in hydraulics and hose application conducted by the company. Or, if your problem is particularly difficult, the distributor can call on the services of Eaton's Field Engineering Staff. The company will send in a hose and hydraulic specialist to study the problem and come up with a solution.

### Improper assembly and installation

The second major cause of premature hose failure is improper assembly and installation procedures. This can involve anything from using the wrong fitting on a hose, to poor routing of the hose.

Eaton provides excellent training material that you can use to combat this problem. A little time spent in training your maintenance people could pay big dividends in reduced downtime.

You can make use of the material available from Eaton to improve your hose assembly and installation techniques.

This material is available free from Eaton, 14615 Lone Oak Road, Eden Prairie, MN 55317. Fax: 952-937-7394.

### External damage

External damage can range from abrasion and corrosion, to hose that is crushed by a lift truck. These are problems that can normally be solved simply once the cause is identified. The hose can be re-routed or clamped, or a fire sleeve or abrasion guard can be used.

In the case of corrosion, the answer may be as simple as changing to a hose with a more corrosion resistant cover or re-routing the hose to avoid the corrosive element.

### Faulty equipment

Too frequent or premature hose failure can be the symptom of a malfunction in your equipment. This is a factor that should be considered since prompt corrective action can sometimes avoid serious and costly equipment breakdown. Reprints of an article on "Troubleshooting Hydraulic Systems," which tells you how to spot problems in a hydraulic system are available from Eaton.

### Faulty hose

Occasionally a failure problem will lie in the hose itself. The

most likely cause of a faulty rubber hose is old age. Check the lay line on the hose to determine the date of manufacture. (2Q99 means second quarter 1999.) The hose may have exceeded its recommended shelf life. If you suspect that the problem lies in the manufacture of the hose (and don't jump to this conclusion until you have exhausted the other possibilities) contact your distributor. Given effective quality control methods, the odds of a faulty batch of hose being released for sale are extremely small. So make sure that you haven't overlooked some other problem area.

### Analyzing failures

A physical examination of the failed hose can often offer a clue to the cause of the failure. Following are 22 symptoms to look for along with the conditions that could cause them:

#### 1. Symptom:

The hose tube is very hard and has cracked.

#### Cause:

Heat has a tendency to leach the plasticizers out of the tube. This is a material that gives the hose its flexibility or plasticity.

Aerated oil causes oxidation to occur in the tube. This reaction of oxygen on a rubber product will cause it to harden. Any combination of oxygen and heat will greatly accelerate the hardening of the hose tube. Cavitation occurring inside the tube would have the same effect.

#### 2. Symptom:

The hose is cracked both exter-

nally and internally but the elastomeric materials are soft and flexible at room temperature.

#### Cause:

The probable reason is intense cold ambient conditions while the hose was flexed. Most standard hoses are rated to -40°F (-40°C). Some AQP hoses are rated at -55°F (-49°C). Military specified hoses are generally rated to -65°F (-54°C). PTFE hose is rated to -100°F (-73°C). Some Polyon thermoplastic hoses are rated at -65°F (-54°C).

#### 3. Symptom:

The hose has burst and examination of the wire reinforcement after stripping back the cover reveals random broken wires the entire length of the hose.

#### Cause:

This would indicate a high frequency pressure impulse condition. SAE impulse test requirements for a double wire braid reinforcement are 200,000 cycles at 133% of recommended working pressure. The SAE impulse test requirements for a four spiral wrapped reinforcement (100R-9) are 300,000 cycles at 133% maximum operating and at +200°F (93°C). If the extrapolated impulses in a system amount to over a million in a relatively short time a spiral reinforced hose would be the better choice.

# Technical Data

## Analyzing Failures

### 4. Symptom:

The hose has burst, but there is no indication of multiple broken wires the entire length of the hose. The hose may have burst in more than one place.

### Cause:

This would indicate that the pressure has exceeded the minimum burst strength of the hose. Either a stronger hose is needed or the hydraulic circuit has a malfunction which is causing unusually high pressure conditions.

### 5. Symptom:

Hose has burst. An examination indicates that the wire braid is rusted and the cover has been cut, abraded or deteriorated badly.

### Cause:

The primary function of the cover is to protect the reinforcement. Elements that may destroy or remove the hose covers are:

1. Abrasion
2. Cutting
3. Battery Acid
4. Steam Cleaners
5. Chemical Cleaning Solutions
6. Muriatic Acid (for cement clean-up)
7. Salt Water
8. Heat
9. Extreme Cold

Once the cover protection is gone the wire reinforcement is susceptible to attack from moisture or other corrosive matter.

### 6. Symptom:

Hose has burst on the outside

bend and appears to be elliptical in the bent section. In the case of a pump supply line, the pump is noisy and very hot. The exhaust line on the pump is hard and brittle.

### Cause:

Violation of the minimum bend radius is most likely the problem in both cases. Check the minimum bend radius and make sure that the application is within specifications. In the case of the pump supply line partial collapse of the hose is causing the pump to cavitate creating both noise and heat. This is a most serious situation and will result in catastrophic pump failure if not corrected.

### 7. Symptom:

Hose appears to be flattened out in one or two areas and appears to be kinked. It has burst in this area and also appears to be twisted.

### Cause:

Torquing of a hydraulic control hose will tear loose the reinforcement layers and allow the hose to burst through the enlarged gaps between the braided plaits of wire strands. Use swivel fittings or joints to be sure there is no twisting force on a hydraulic hose.

### 8. Symptom:

Hose type has broken loose from the reinforcement and piled up at the end of the hose. In some cases it may protrude from the end of the hose fitting.

### Cause:

The probable cause is high vacuum or the wrong hose for vacuum service. No vacuum is recommended for double wire braid, 4 and 6 spiral wire hose unless some sort of internal coil support is used. Even though a hose is rated for vacuum service, if it is

kinked, flattened out or bent too sharply this type of failure may occur.

### 9. Symptom:

Hose has burst about six to eight inches away from the end fitting. The wire braid is rusted. There are no cuts or abrasions of the outer cover.

### Cause:

Improper assembly of the hose end fitting allowing moisture to enter around the edge of the fitting socket. The moisture will wick through the reinforcement. The heat generated by the system will drive it out around the fitting area but six to eight inches away it will be entrapped between the inner line and outer cover causing corrosion of the wire reinforcement.

### 10. Symptom:

There are blisters in the cover of the hose. If one pricks the blisters, oil will be found in them.

### Cause:

A minute pin hole in the hose tube is allowing the high pressure oil to seep between it and the cover. Eventually it will form a blister wherever the cover adhesion is weakest. In the case of a screw together reusable fitting insufficient lubrication of the hose and fitting can cause this condition because the dry tube will adhere to the rotating nipple and tear enough to allow seepage. Faulty hose can also cause this condition.

### 11. Symptom:

Blistering of the hose cover where a gaseous fluid is being used.

### Cause:

The high pressure gas is effusing through the hose tube, gathering under the cover and eventually forming a blister wherever the adhesion is weakest. Specially

constructed hoses are available for high pressure gaseous applications. Your supplier can advise you on the proper hose to use in these cases.

### 12. Symptom:

Fitting blew off of the end of the hose.

### Cause:

It may be that the wrong fitting has been put on the hose. Recheck manufacturer's specifications and part numbers.

In the case of a crimped fitting, the wrong machine setting may have been used resulting in over or undercrimping. The socket of a screw together fitting for multiple wire braided hose may be worn beyond its tolerance. The swaging dies in a swaged hose assembly may be worn beyond the manufacturer's tolerances.

The fitting may have been applied improperly to the hose. Check manufacturer's instructions. The hose may have been installed without leaving enough slack to compensate for the possible 4% shortening that may occur when the hose is pressurized. This will impose a great force on the fitting. The hose itself may be out of tolerance.

### 13. Symptom:

The tube of the hose is badly deteriorated with evidences of extreme swelling. In some cases the hose tube may be partially "washed out."

### Cause:

Indications are that the hose tube is not compatible with the agent being carried. Even though the agent is normally compatible, the addition of heat can be the catalyst that can cause inner liner dete-

# Technical Data

## Analyzing Failures

rioration. Consult your hose supplier for a compatibility list or present him with a sample of the fluid being conducted by the hose for analysis. Make sure that the operating temperatures both internal and external do not exceed recommendations.

### 14. Symptom:

Hose has burst. The hose cover is badly deteriorated and the surface of the rubber is crazed.

### Cause:

This could be simply old age. The crazed appearance is the effect of weathering and ozone over a period of time. Try to determine the age of the hose. Some manufacturers print or emboss the cure date on the outside of the hose. As an example, Eaton Aeroquip hose would show "4Q73" which would mean that the hose was manufactured during the fourth quarter (October, November or December) of 1973.

### 15. Symptom:

Hose is leaking at the fitting because of a crack in the metal tube adjacent to the braze on a split flange head.

### Cause:

Because the crack is adjacent to the braze and not in the braze, this is a stress failure brought on by a hose that is trying to shorten under pressure and has insufficient slack in it to do so. We have cured dozens of these problems by lengthening the hose assembly or changing the routing to relieve the forces on the fitting.

### 16. Symptom:

A spiral reinforced hose has burst and literally split open with the wire exploded out and badly entangled.

### Cause:

The hose is too short to accommodate the change in length occurring while it is pressured.

### 17. Symptom:

Hose is badly flattened out in the burst area. The tube is very hard down stream of the burst but appears normal up stream of the burst.

### Cause:

The hose has been kinked either by bending it too sharply or by squashing it in some way so that a major restriction was created. As the velocity of the fluid increases through the restriction the pressure decreases to the vaporization point of the fluid being conveyed. This is commonly called cavitation, and causes heat and rapid oxidation to take place which hardens the tube of the hose down stream of the restriction.

### 18. Symptom:

Hose has not burst but it is leaking profusely. A bisection of the hose reveals that the tube has been gouged through to the wire braid for a distance of approximately two inches.

### Cause:

This failure would indicate that erosion of the hose tube has taken place. A high velocity needle-like fluid stream being emitted from an orifice and impinging at a single point on the hose tube will hydraulically remove a section of it. Be sure that the hose is not bent close to a port that is orificed.

In some cases where high velocities are encountered particles in the fluid can cause considerable erosion in bent sections of the hose assembly.

### 19. Symptom:

The hose fitting has been pulled out of the hose. The hose has been considerably stretched out in length. This may not be a high pressure application.

### Cause:

Insufficient support of the hose. It is very necessary to support very long lengths of hose, especially if they are vertical. The weight of the hose along with the weight of the fluid inside the hose in these cases is being imposed on the hose fitting. This force can be transmitted to a wire rope or chain by clamping the hose to it much like the utilities support bundles of wire from pole to pole. Be sure to leave sufficient slack in the hose between clamps to make up for the possible 4% shortening that could take place when the hose is pressurized.

### 20. Symptom:

The hose has not burst but it is leaking profusely. An examination of the bisected hose reveals that the tube has burst inwardly.

### Cause:

This type of failure is commonly referred to as hose tube blow down. It is usually associated with very low viscosity fluids such as air, nitrogen, freon and other gases. What happens is that under high pressure conditions the gases will effuse into the pores of the hose tube charging them up like miniature accumulators. If the pressure is very suddenly reduced to zero, the entrapped gases literally explode out of the tube often tearing holes in it. In some hose constructions a second hose tube made from a plastic such as nylon, is inserted into the hose.

A small leak will allow the gaseous fluid to seep between the two inner liners and when the pressure is reduced to zero the innermost liner will collapse because of the entrapped pressure around its outer diameter.

### 21. Symptom:

PTFE hose assembly has collapsed internally in one or more places.

### Cause:

One of the most common causes for this is improper handling of the PTFE assembly. PTFE is a thermoplastic material which is not rubber-like. When bent sharply it simply collapses. This type of collapse is localized in one area and is radial. When the PTFE tube is folded longitudinally in one or more places this could be the result of heat (which softens the hose tube) along with vacuum conditions inside of it. Because of the additional tension of the wire braid reinforcement inherent with this type of hose, there is always a radial tension on the tube trying to push it in. Rapid cycling from a very hot agent in the hose to a very cold agent in the hose can produce the same type of failure. Eaton offers an internal support coil that will eliminate this problem.

### 22. Symptom:

A PTFE hose assembly has developed a pin hole leak or several pin hole leaks.

### Cause:

This situation occurs when a petroleum base fluid, with a low viscosity, is flowing at a high velocity. This condition can generate high voltage due to static electricity. The high voltage is seeking a ground connection and the only ground connection available is the braided stainless steel reinforcement. This causes an electric arc, which penetrates through the PTFE tube as it travels to the reinforcement. Specially constructed PTFE tubes are available that have enough carbon black in them so as to be conductive. They will "drain off" the static electricity and preclude this problem.

## How to Identify Fluid Connectors

### Measuring Tools

Order part number FT1341 for Eaton Aeroquip Tool Kit. A seat angle gauge, thread pitch gauge and an I.D./O.D. caliper are necessary to make accurate measurements of commonly used connectors. Eaton Aeroquip offers a unique new caliper that offers the capabilities of both a caliper and a seat angle gauge in one unit.

I.D./O.D. Angle Gauge Caliper

Thread Pitch Gauge

### How to Measure Threads

Use a thread pitch gauge to determine the number of threads per inch or the distance between threads in metric connections. Place the gauge on the threads until the fit is snug. Match the measurement to the charts.

Measure the thread diameter with an I.D./O.D. caliper as shown. Match the measurements to the charts.

### How to Measure Sealing Surface Angles

Female connections are usually measured by inserting the gauge into the connection and placing it on the sealing surface. If the centerlines of the connection and gauge are parallel, the correct angle has been determined.

Male flare type connectors are usually measured by placing the gauge on the sealing surface. If the centerlines of the connection and gauge are parallel, the correct angle has been determined.

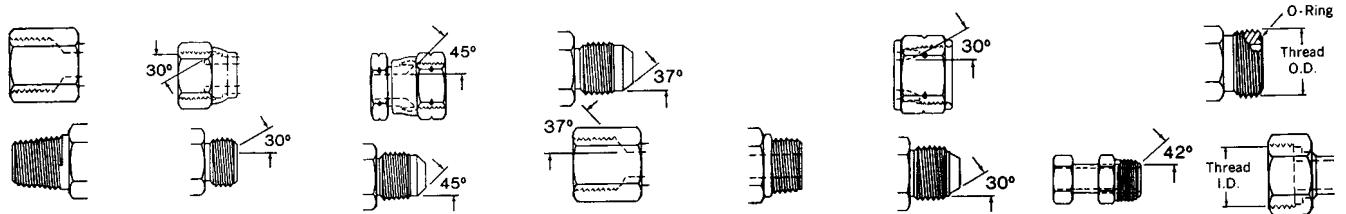

# Technical Data

## Thread Size

## How to Identify Fluid Connectors

### How to Measure Non-threaded connections

**Four Bolt Flange**—First measure the port hole diameter using the caliper. Next, measure the longest bolt hole spacing from center-to-center or measure the flange head diameter.

**Staplok®**—Measure the male diameter with the O.D. portion of the caliper. Measure the female half by inserting the I.D. portion of the caliper into the through hole.

### Dash Numbers

Most fluid piping system sizes in the United States are measured by dash numbers. These are universally used abbreviations for the size of the component expressed as the numerator of the fraction with the denominator always being 16. For example, a -04 port is  $\frac{4}{16}$  or  $\frac{1}{4}$ -inch. Dash numbers are usually nominal (in name only) and are abbreviations that make ordering of components easier.

### American connections NPTF (National Pipe Tapered Fuel)

This connection is still widely used in fluid power systems, even though it is not recommended by the National Fluid Power Association (NFPA) for use in hydraulic applications. The thread is tapered and the seal takes place by deformation of the threads.

#### NPTF Threads

Measure thread diameter and subtract  $\frac{1}{4}$ -inch to find the nominal pipe size.

INCH SIZE	DASH SIZE	NOMINAL THREAD SIZE	MALE THREAD O.D. (INCH)		FEMALE THREAD I.D. (INCH)

### American connections NPSM (National Pipe Straight Mechanical)

This connection is sometimes used in fluid power systems. The female half has a straight thread and an inverted 30° seat. The male half of the connection has a straight thread and a 30° internal chamfer. The seal takes place by compression of the 30° seat on the chamfer. The threads hold the connection mechanically.

**NOTE:** A properly chamfered NPTF male will also seal with the NPSM female.

## How to Identify Fluid Connectors

### American connections

#### SAE J1926 Straight Thread O-Ring Boss (ORB)

This port connection is recommended by the NFPA for optimum leakage control in medium and high pressure hydraulic systems. The male connector has a straight thread and an O-Ring. The female port has a straight thread, a machined surface (minimum spotface) and a chamfer to accept the O-Ring. The seal takes place by compressing the O-Ring into the chamfer. The threads hold the connection mechanically.

INCH SIZE	DASH SIZE	NOMINAL THREAD SIZE	MALE THREAD O.D. (INCH)		FEMALE THREAD I.D. (INCH)	
			FRACTION	DECIMAL	FRACTION	DECIMAL

2	32	2 -12	2 1/2	2.50	2 1/16	2.42

### American connections

#### SAE J514i\* 37 Hydraulic

This connection is very common in fluid power systems. Both the male and female halves of the connections have 37° seats. The seal takes place by establishing a line contact between the male flare and the female cone seat. The threads hold the connection mechanically.

**CAUTION:** In the  $\text{D}02$ ,  $\text{D}03$ ,  $\text{D}04$ ,  $\text{D}05$ ,  $\text{D}08$  and  $\text{D}10$  sizes, the threads of the SAE 45i flare and the SAE 37i flare are the same. However, the sealing surface angles are not the same.

INCH SIZE	DASH SIZE	NOMINAL THREAD SIZE	MALE THREAD O.D. (INCH)		FEMALE THREAD I.D. (INCH)

## Thread Engagement Dimensions

### Thread engagement dimensions—Nominal

Dimensions may vary due to tolerance conditions.

Listed below are the thread engagement dimensions (B) which must be taken into consideration when making connections with ports or appropriate female adapters.

The "B" dimension must be subtracted from the overall length (a) to insure proper connection.

DASH SIZE	STRAIGHT AND ANGLED DIMENSION "B"	STRAIGHT AND ADJUSTABLE DIMENSION "B"	STRAIGHT AND ADJUSTABLE DIMENSION "B"
Ø02	.25		
Ø04	.38	.36	.43
Ø05		.36	.43
Ø06	.38	.39	.47
Ø08	.50	.43	.55
Ø10		.50	.63
Ø12	.62	.59	.73
Ø14		.59	
Ø16	.69	.59	.73
Ø20	.69	.59	.73
Ø24	.69	.59	.73
Ø32	.75	.59	

### Allowable bulkhead thickness For ORS:

DASH SIZE	HOLE DIAMETER	ORS BULKHEAD THICKNESS MIN	MAX
Ø04	.575 +.015/Ø.000	.195	.500
Ø06	.700 +.015/Ø.000	.200	.590
Ø08	.825 +.015/Ø.000	.220	.590
Ø10	1.015 +.015/Ø.000	.230	.590
Ø12	1.200 +.015/Ø.000	.245	.590
Ø16	1.450 +.015/Ø.000	.245	.600
Ø20	1.715 +.015/Ø.000	.245	.600
Ø24	2.030 +.015/Ø.000	.245	.600

### For 37<sub>i</sub> Flare:

DASH SIZE	HOLE DIAMETER	37° BULKHEAD THICKNESS STRAIGHTS MIN	MAX	SHAPES MIN	MAX
Ø03	.391 +.016/Ø.000	.047	.406	.125	.250
Ø04	.453 +.016/Ø.000	.047	.406	.125	.281
Ø05	.516 +.016/Ø.000	.047	.406	.125	.281
Ø06	.578 +.016/Ø.000	.047	.438	.125	.297
Ø08	.766 +.016/Ø.000	.047	.438	.156	.344
Ø10	.891 +.016/Ø.000	.047	.469	.156	.359
Ø12	1.076 +.016/Ø.000	.047	.469	.156	.375
Ø16	1.328 +.016/Ø.000	.047	.469	.156	.375
Ø20	1.656 +.031/Ø.000	.047	.469	.156	.375
Ø24	1.906 +.031/Ø.000	.047	.469	.156	.375

All dimensions in inches. Dimensions may vary due to tolerance conditions.

## Tube Installation

### Proper tube installation

fig. 1

When compared to rigid pipe, hydraulic tubing offers the following advantages:

1. Size for size, tubing is lighter in weight, easier to handle and can be bent more easily than iron pipe.
2. Bent tubing reduces pressure drop and turbulence in the system because it eliminates sudden change in the direction of the fluid flow.
3. Hydraulic tubing reduces the number of connections required, thus reducing material and labor costs.
4. Fewer joints means lower costs and fewer points of potential leakage.
5. The use of tube fittings makes every joint a union which permits easier, faster maintenance and repair work.
6. The Eaton Aeroquip ORS-TF Tube Fitting eliminates the need for threading, brazing or welding.

fig. 2

### Tube bending

To reduce the number of fittings in a tube assembly, bend the tubing whenever possible.

Steel tubing can be bent in many sizes by using a hand bender designed for steel tubing. For production quantities, or for larger sizes, a power bending tool is generally used. Contact Eaton for additional tube bending information.

fig. 3

### Tube routing and installation

Tubing manufacturers will advise the correct radii for various types and wall thicknesses of tubing. Kinks, flattened bends, wrinkles and tube breakage can be avoided by the use of proper tube bending equipment.

Avoid straight line connections whenever possible, especially in short runs.

Fluid conveying systems (see figures 2, 3 and 4) should be designed to follow the contour of the equipment. They are easier to install and present a neater appearance. Long runs should be supported by brackets or clamps. All heavy systems components should be bolted or clamped to eliminate tubing fatigue.

fig. 4

Inspect the tubing to see that it conforms to the required specifications before installation.

Tubes should align with the center line of the fittings, without distortion or tension. Tubing should not be sprung into position (see figure 1) to be assembled to the fitting. If this occurs the tubing has not been properly fabricated, and when installed and connected, places the tubing under stress.

# Technical Data

## Bend/Flexing Graphs

### Bend Radius vs. Operating Pressure

The charts below show graphically the variation in operating pressure when hose is subjected to various degrees of bend. When hose is subjected to bends smaller than recommended, hose operating pressure limits are reduced. Likewise, if hose is subjected to lower operating pressures a small bend radius may be used.

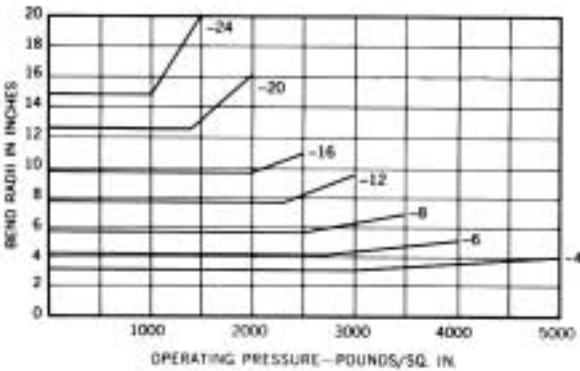

NOTE: Minimum bend radius is measured at inside of bend.

### Single Wire Braid Hose bend radius with no flexing AE369, AE372

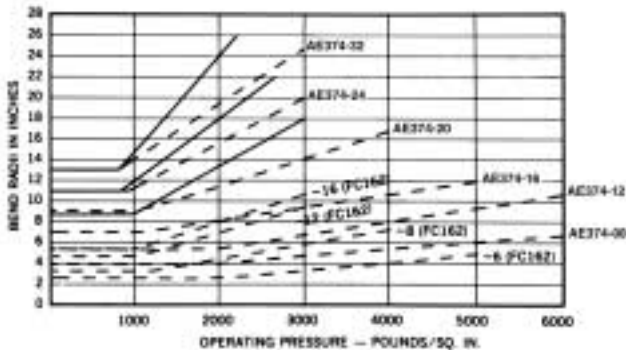

NOTE: Minimum bend radii for larger sizes at all pressure are as follows  
 -32 = 13 1/4 inches  
 -40 = 24 inches  
 -48 = 33 inches

### Double Wire Braid Hose bend radius with no flexing AE371, AE373, FC163

### Spiral Wrap Hose bend radius with no flexing AE374, FC162

### Flexing

Minimum bend radius under flexing conditions = Bend factor "N" x Bend radius of the hose with no flexing

EXAMPLE: For AE369 Hose, -12 size at 1500 psi and with flexing range of 60°:

Minimum bend radius = 1.16 x 6.5 = 7 1/2 inches (measured at inside of bend).

Free lengths of hose required for deflections of 10" or less  
 150901, AE37, AE373, FC163

AE369, AE370, AE372, FC234

Example:  
 2" deflection of FC163-20 Hose requires 111 1/4" free length of hose

Example:  
 1" deflection of AE369-20 Hose requires 6" free length of hose

### Computing Piston Area

The area of a piston or ram can be computed by this formula:

$$A = \frac{p \times d^2}{4}$$

A is area (square inches or square centimeters)

d is diameter of piston (inches or centimeters)

p/4 is 0.7854

These pressure, force and area relationships are sometimes illustrated as shown below to aid in remembering the equations.

$$F = P \times A$$

$$P = F/A$$

$$A = F/P$$
